Compliance & Sustainability

December 9, 2015 Reference No. 013968

Mr. Peter Ramanauskas
Project Manager for IND 0060306099
Land and Chemicals Division
U.S. EPA Region 5
77 West Jackson Blvd. (LU-9J)
Chicago, IL 60604-3507

Dear Mr. Ramanauskas:

Re: Construction Certification Report – Downstream Parcels Removal Action
GM CET – Bedford Facility, IND 006036099, AOC Docket No. RCRA-05-2014-0011
RCRA Corrective Action
Bedford, Indiana

Enclosed for your review, please find a copy of the report entitled Construction Certification Report: Downstream Parcels Removal Action. This document has been submitted by Conestoga-Rovers & Associates (CRA), on behalf of General Motors LLC (GM), to present the final construction certification of the Downstream Parcels in accordance with the Conditions of the Administrative Order on Consent (AOC) dated August 4, 2014 (AOC Docket No. RCRA-05-2014-0011).

Should you have any questions regarding this document, please do not hesitate to contact me at (313) 510-4328.

Yours truly,

General Motors LLC

Cheryl R. Hiatt
Project Manager

Section 1.0 Introduction

1.1 General

This document presents the Final Construction Certification Report (Report) for the implementation of the United States Environmental Protection Agency (U.S. EPA) approved Downstream Parcels Removal Action Work Plan (Work Plan), dated May 25, 2004 for properties adjacent to Bailey's Branch Creek in the Pleasant Run Watershed (Bailey's Branch Creek) in Lawrence County, Indiana. This work was initiated by General Motors Corporation under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Administrative Order on Consent (AOC) (effective July 31, 2003, U.S. EPA Docket No. V-W-'03-C-747). Bailey's Branch Creek and areas downstream were affected by historical releases of polychlorinated biphenyls (PCBs). This Report describes the Removal Action (RA) completed in areas referred to as the Downstream Parcels in the CERCLA AOC. Documentation for the completion of the Removal Actions associated with the Upstream Parcels and Parcel 22 were submitted to U.S. EPA on October 1, 2007, and May 14, 2010, respectively.

As U.S. EPA is aware, General Motors Corporation (since renamed Motors Liquidation Company [MLC]) filed for bankruptcy protection in June of 2009 and sold a number of its assets on July 10, 2010 to form General Motors LLC (GM). Several of the properties related to the Downstream Parcels were retained by MLC and placed in trust with Revitalizing Auto Communities Environmental Response (RACER) Trust, and were not included in the asset sale. Conestoga-Rovers & Associates, Inc. (CRA) has prepared this Report on behalf of GM under the Resource Conservation and Recovery Act (RCRA) AOC (effective August 4, 2014, U.S. EPA Docket No. RCRA-05-2014-0011). The work described in this Report was conducted in accordance with the CERCLA AOC, the requirements of the Toxic Substances Control Act (TSCA), and consistent with the Corrective Action (CA) work conducted under the Performance Based Agreement (effective March 20, 2001, as amended October 1, 2002, March 29, 2007, and May 9, 2008) with U.S. EPA for the GM Bedford Castings, Engines and Transmissions (CET; formerly Powertrain) Facility (Facility).

For the purposes of this Report, the Downstream Parcels is comprised of both GM LLC and RACER Trust Properties and refers to Parcels 13, 15, 20, 21, 23, 24, 25, 27, 28, 29, 30, 36, 37, 38, 39, 40, 72, 76, 78, 81, and 216 (east of Bailey Scales Road), which will be referred to collectively as the Site. This Report covers the Downstream Parcels for remedial work; however, it should be noted that RACER assumed responsibility for Parcels 13, 20, 23A, 27, 28A, 37, 38, 39, 76, and 78, while GM LLC maintained responsibility for GM LLC owned Parcel 216 (east of Bailey Scales Road), and third party owned Parcels 15, 21, 24, 25, 29, 30, 36, 40, 72, and 81. For backfill, final grading, and restoration, this Report only describes activities for GM LLC and third-party owned

properties as described in the RCRA AOC. The Site location is presented on Figure 1.1. The Site Plans for the Downstream Parcels are presented on Figures 1.2.1, 1.2.2, and 1.2.3.

This Report documents the completion of the RA activities in accordance with the Work Plan that was approved by U.S. EPA as a requirement of the CERCLA AOC. The Work Plan was implemented starting in the fall of 2004 and completed in summer 2014. Specifically, this Report describes the implementation of the Work Plan, including the excavation of impacted soil, verification sampling to confirm achievement of the CERCLA AOC cleanup criteria, staging of waste, waste characterization sampling and analysis, transportation and off-Site disposal of the material at appropriate permitted landfill facilities, backfilling of the excavations, and restoration of the GM LLC owned and third party owned properties. A photographic log of pre- through post-excavation Site conditions is presented in Appendix A. Parcel 13 is represented in Photographs No.1-3; Parcels 15 and 216 are presented in Photographs No.4 – 28; Parcels 20 and 21 are presented in Photographs No.29 – 42; Parcels 23, 24, 76 and 78 are presented in Photographs No.43 – 66; Parcels 25 is presented in Photographs No.67 – 72; Parcel 28 is presented in Photographs No.73 – 83; Parcels 29 and 30 are presented in Photographs No.84 – 95; Parcel 36 is presented in Photographs No.96 – 109; Parcel 37 is presented in Photographs No.110 – 117; Parcels 38 and 39 are presented in Photographs No.118 – 130; Parcel 40 is presented in Photographs No.131 – 143; Parcel 81 is presented in Photographs No.144 – 147; and Miscellaneous Locations are presented in Photographs No.148-159.

1.2 Project Background

The Facility is located at 105 GM Drive, Bedford (Lawrence County), Indiana. At the onset of the Work Plan implementation, the Facility produced aluminum casting products, such as transmission cases, pistons, and engine blocks. Major aluminum production processes include die casting and permanent molding. The Facility has been operating as an aluminum foundry since 1942, with major facility modifications completed in 1950, 1953, 1966, 1971, 1974, 1977, 1979, and 1980. The Facility is currently undergoing additional modifications.

Located on 152.5 acres, the Facility contains approximately 915,000 square feet (ft^2) of floor space and employs approximately 450 people. The Facility background is summarized in further detail in the Current Conditions Report, prepared by CRA, dated May 25, 2001.

The objective of the Site RA for the Downstream Parcels was to:

- Excavate and remove soil containing PCBs exceeding the cleanup criteria, identified in the initial CA investigation

- Complete verification sampling to document that the cleanup criteria were met
- Dispose of the excavated material at appropriate U.S. EPA approved facilities
- Restore the remediated areas to generally similar conditions

1.3 Pre-removal Action Site Description

The Downstream Parcels are located in the area surrounding Bailey's Branch Creek and Pleasant Run. Bailey's Branch Creek generally flows north from the Facility and discharges to Pleasant Run. Pleasant Run generally flows northwest and subsequently discharges to Salt Creek.

The Downstream Parcels lie within an area of Indiana that was not glaciated (driftless area) during the last glacial period on the North American continent. The maximum progression of the Illinoisan Glacial advance (the furthest advance of the Laurentide Ice Sheet) lies to the west, north, and east of the immediate region surrounding the Downstream Parcels. Consequently, the surficial geology of the area generally consists of a relatively thin layer of unconsolidated deposits of sand, clay, and chert produced by the weathering of limestone bedrock (regolith, which is more commonly referred to as terre rosa in this area due to its reddish color) and wind-deposited silty material, known as loess. Thicker deposits of proglacial outwash, lake sediment, and recent colluvium occur along the major stream valleys. These surficial unconsolidated deposits range in thickness from zero feet along bedrock outcrops to approximately 100 feet thick along Salt Creek and the East Fork of the White River.

Parcels 13, 15, 20, 21, and 216 (east of Bailey Scales Road) border Bailey's Branch Creek along steep sided ravines. In this area, the ravine is generally 20 to 30 feet in vertical relief. Along this length, the creek has a bedrock bottom with scattered sediment deposits. Bedrock can generally be found approximately 1 to 2 feet below the ground surface on the ravine side slopes. Parcels 23, 24, 25, 27, 28, 29, 30, 36, 37, 38, 39, 40, 72, 76, 78, and 81, are situated where the floodplain along Bailey's Branch Creek and Pleasant Run begins to widen as topographic relief diminishes. Along this length, the creek bottom consists of bedrock, large cobbles and boulders, and fine to coarse-grain sediments. The transition between bedrock and unconsolidated creek sediment materials is gradual. Bedrock is more prevalent in the upper section of this reach (generally Parcels 23 through 29), with unconsolidated sediments forming the creek bottom in the lower section of the reach (generally Parcel 30 and downstream). The Downstream Parcels encompass a floodplain area of approximately 365 acres, of which only a narrow portion along the creek was contaminated. The contaminated area of Parcels 13, 15, 20, and 21 was restricted to the bottom of the steep sided ravine and thus limited exposure. Parcel 13 is located within the Bedford city limits and is zoned for residential use. The remaining Parcels are located outside the Bedford city limits in Lawrence County and are not zoned. While there are fewer land use restrictions for parcels outside the city limits, the

reasonably anticipated future use for these parcels will to be retained by private individuals for residential, agricultural, and/or recreational use.

1.4 Cleanup Objectives

The cleanup criterion selected by U.S. EPA in the CERCLA AOC for floodplain soils at the Site is 1.8 milligrams per kilogram (mg/kg) total PCBs. The CERCLA AOC also identified a cleanup criterion of 1 mg/kg total PCBs for creek sediment and stream bank material at the Site. Both criteria are considered conservative in their application in this RA based upon the actual conditions of the Site. Based on discussion with U.S. EPA, stream bank material has been defined in the CERCLA AOC as the material located horizontally to a distance 2 feet from the edge of the stream channel, and vertically down to the top elevation of the bedrock streambed following sediment removal.

1.5 Property Access

Prior to implementing the RA for the Downstream Parcels, access was obtained from the owners of Parcels 15, 20, 21, 23, 24, 25, 28, 29, 30, 36, 39, 40, 72, and 81. Parcel 216 was owned by General Motors Corporation prior to the initiation of RA activities.

Communication with the Parcel owners prior to implementation of the RA on their property included:

- Review of work activities to be completed including identification of anticipated work areas.
- Review of trees/significant vegetation which would require clearing to complete the RA. Those trees required to be cleared were marked in the field and reviewed with the owner prior to clearing, however, additional vegetation may have been cleared as the actual cleanup progressed.
- Review of a map with property owners which identified conceptual re-grading and preliminary planting locations and types to replace cleared vegetation. Site related Tree Plans for Parcels 15, 29, 30, 36, 40, and 72 are presented in Appendix B.
- Periodic updates of work progress and anticipated completion through public meetings.

1.6 Report Organization

This Report is organized in the following sections:

i) Section 1.0 presents the Site location and background, pre-RA Site description, cleanup objectives, property access, and organization of the Report.

ii) Section 2.0 presents a summary of the Scope of Work (SOW) for the Work Plan implementation.

iii) Section 3.0 presents a summary of investigative sampling and Site characterization activities.

iv) Section 4.0 presents the RA activities implemented during the work including Site preparation; environmental controls including fugitive dust, erosion, and stormwater; soil excavation, verification sampling; backfilling, and final grading; stockpile sampling and waste characterization; transportation and disposal of waste; and ambient air quality monitoring.

v) Section 5.0 provides details of the restoration activities conducted on third-party and GM LLC Parcels.

vi) Section 6.0 provides a summary of RA activities for the Downstream Parcels.

vii) Section 7.0 presents references cited in this Report.

viii) Section 8.0 provides certification of the Work Plan completion.

Section 2.0 Scope of Work

This section provides a summary of the SOW that was conducted at the Site. CRA, as designated in the CERCLA AOC, directed and oversaw activities on behalf of General Motors Corporation prior to June 2009 bankruptcy and GM LLC subsequently (collectively referred to as "GM" hereafter) during the implementation of the RA, including collection and management of related data and development and preparation of this Report. The Project Coordinator designated in the CERCLA AOC (Mr. James J. McGuigan, CRA) provided overall project management and coordination between GM, CRA, the selected environmental contractors (Sevenson Environmental Services, Inc. [SES]; ENTACT, LLC [ENTACT]; and HIS Constructors [HIS]), the Facility, property owners, U.S. EPA, and Indiana Department of Environmental Management (IDEM).

The RA field activities were initiated following review and approval of the Work Plan by U.S. EPA in coordination with IDEM and the procurement of necessary permits, access agreements, and contractors. Some of these activities were completed concurrently with preparations for the Upstream Parcels RA and the Parcel 22 RA activities, or with on-Facility work related to the RCRA CA. These activities included:

- Locating utilities

- Mobilization of construction facilities, Site trailer(s), material, equipment, and personnel necessary to perform the work
- Provision and maintenance of construction facilities and temporary controls
- Preparation of the Site including
  - Establishment of emergency first aid facility
  - Establishment of fire suppression equipment
  - Construction of decontamination facilities
  - Construction of break facilities
  - Installation of temporary utilities
  - Construction of access roads
  - Clearing and grubbing of existing vegetation (as required)
  - Identification of work zones
  - Construction of temporary staging facilities
- Implementation of environmental controls
- Implementation of a Site-specific Health and Safety Plan (HASP)
- Diversion of creek (sequential in work zones)
- Implementation of storm water controls (berms and drainage swales)
- Removal and handling of sediment deposits in creek bed and stream bank soils, to bedrock or 1 mg/kg PCBs, while the creek was diverted
- Soil excavation, handling, and backfilling including
  - Layout of initial excavation limits including areas of PCB concentrations equal to or exceeding 50 mg/kg (≥50 mg/kg), and areas between 1.8 mg/kg and 50 mg/kg
  - Excavation of floodplain soil to statistically achieve 1.8 mg/kg PCBs cleanup criterion
  - Excavation of stream bank and creek sediment to achieve 1.0 mg/kg PCBs cleanup criterion
  - Layout of verification sampling grids
  - Collection of soil verification samples for PCBs
  - Calculation of the 95-percent upper confidence limit to meet the cleanup criterion for half-acre verification grids with one or more sample greater than 1.8 mg/kg but no samples exceeding 5 mg/kg
  - Additional excavation/verification sampling, as necessary, to meet the cleanup objectives

  - Backfilling/grading and restoration of excavated areas, as required, with appropriate materials and vegetation
- Transportation to a U.S. EPA approved off-Site disposal facility for soil and sediment ≥50 mg/kg PCBs
  - If direct loading for off-Site disposal was not practical, soil and sediment were moved to a temporary staging pad prior to off-Site disposal
- Transportation of soils less than 50 mg/kg (<50 mg/kg) PCBs to U.S. EPA approved on-Site staging facilities for final placement under the East Plant Area Cover System. If transported to an interim staging facility, soils were stored for a period consistent with the terms of the CERCLA AOC
- Removal of miscellaneous debris (e.g., tree stumps, rocks), and staging and/or disposal at appropriate off-Site facilities (as required)
- Monitoring of fugitive air emissions
- Monitoring of ambient air quality
- Water management
- RA closeout activities including:
  - Cleanup/restoration of support areas
  - Restoration of excavation areas
  - Final decontamination of construction equipment and temporary facilities
- Demobilization of temporary facilities and equipment from the Site

2.1 Work Plan Addenda

During implementation of the Work, several unanticipated conditions were observed that necessitated modifying the Work Plan through preparation of various addenda to the Removal Action Work Plans, which were reviewed and approved by U.S. EPA. Addenda to the Work Plans include:

- Revised Parcel 22/Downstream Parcels Removal Action Work Plans: Addendum No. 1 (CRA, May 10, 2005) (U.S.EPA approval on June 15, 2005): Addendum No. 1 presented modified material stockpile sampling methods and handling procedures for the <50 mg/kg PCBs RA material. These procedures were prepared for the transportation of <50 mg/kg PCBs RA material to the East Plant Area.
- Downstream Parcels RA Work Plan: Addendum No. 2 (CRA, April 25, 2005) (U.S. EPA approval on November 7, 2005): Addendum No. 2 presented revised drawing set

containing changes made to certain works within the Downstream Parcels and applying only to parcels located on Bailey's Branch Creek downstream of the Broomsage Road Bridge.

- Downstream Parcels RA Work Plan: Addendum No. 3 – Revision 1 (CRA March 25, 2011) (U.S. EPA approval on March 31, 2011): Addendum No. 3 provided supplemental delineation information and revised procedures for prescriptive removal for the remaining PCB impacted soil excavation beneath the former Staging Area G footprint (located on Parcel 39).

Additional modifications were applied to the Downstream Parcels based on discussions with U.S. EPA. The applicable modifications included:

- Addendum No. 4 to the Upstream Parcels RA Work Plan (CRA, June 15, 2004) (U.S. EPA approval on June 30, 2004) presented revised soil verification sampling procedures for sidewall sampling from the Upstream Parcels requiring sidewall samples with 5-ft aliquot spacing. The revised sampling procedures presented in this addendum were carried forward into the Downstream Parcels work. The spacing was maintained on parcels south of Broomsage Road through the completion of the removal activities, and reverted to the 10-ft spacing of the Downstream Parcels RA Work Plan on parcels located north of Broomsage Road following U.S. EPA approval on June 30, 2004.
- Due to the long-term data record of no detections, modifications to the PCB and total suspended particulates (TSPs) air monitoring program were completed on three separate occasions to reduce the frequency of air PCB monitoring (November 23, 2004), to reduce the coverage of PCB monitoring (March 9, 2006), and termination of the high-volume 24-hour PCB and TSP air monitoring as of October 6, 2008 (based on U.S. EPA approval via email) and implementation of real-time monitoring of TSPs in active work areas by contractors, which was formally requested in a letter to U.S. EPA on October 29, 2008.
  - Modifications to the Ambient Air Quality Monitoring Program (AAQMP) (CRA, November 23, 2004) (U.S. EPA Approval on November 30, 2004)
  - Additional Modifications to the AAQMP (CRA, March 9, 2006) (U.S. EPA Approval on April 4, 2006)Modification Request to the AAQMP (CRA, October 29, 2008) (U.S. EPA Approval October 6, 2008)
- Proposed Modifications to the Current Stockpile Sampling Program(CRA, February 1, 2007) (U.S. EPA Approval on March 5, 2007) were presented to the U.S.EPA due to a decline in overall PCB concentrations associated with the excavation progression further downstream and sediments deposited on clay rather than directly on bedrock. Revised stockpile sampling procedures were approved by U.S. EPA prior to implementation.

2.2 Site Source Control Systems

A Site Source Control (SSC) Work Plan (CRA, November 11, 2003) (U.S.EPA approval on May 25, 2004) and associated addenda were initiated concurrently under the RA. The SSC Work Plan presented parameters for identifying, monitoring, containing and controlling impacted springs. The presence of seeps and springs on the downstream parcels were identified during the investigation phases of the SSC Work Plan and as observed during the Downstream Parcels work.

Based on investigations completed under the SSC Work Plan and addenda, Spring 018 (located on Parcel 15) was found to have been impacted by historical releases of PCBs from the Facility. In 2012-2013, GM implemented an interim measure by which the creek bed upstream of the spring was sealed with concrete. The Construction Certification Report for the creek sealing activities was submitted to U.S. EPA on February 20, 2014. The demobilization of Sevenson's Spring 018 Water Treatment Plant and Spring 018 Contingency Plan (CRA, February 24, 2014) (U.S.EPA approval on March 10, 2014) outlines the requirements for on-going monitoring of the spring.

2.3 Sampling and Analysis

Sample collection, laboratory analysis and data validation were completed in accordance with the site-specific Quality Assurance Project Plan (QAPP) (CRA, November 5, 2001). The QAPP was modified (August 13, 2003, December 21, 2004, and July 25, 2006) in accordance with the CERCLA AOC and was approved by U.S. EPA for use in the implementation of the Downstream Parcels RA.

Section 3.0 Corrective Action Investigative/Delineation Sampling/Site Characterization Activities

As part of the initial evaluation of off-Facility properties in 2001 and 2002, investigative soil and sediment sampling was conducted within the floodplain and creek areas of the Downstream Parcels. Figures 3.1.1 through 3.1.22 identify the location of investigative samples collected. PCBs were identified in soil and sediment at varying concentrations at locations within the creek and floodplain area of the Downstream Parcels. The results of this sampling were compared to the cleanup objectives and utilized to develop the proposed initial excavation limits described in the Work Plan.

PCB concentrations were determined to be present in creek sediments and in floodplain soils adjacent to the creek. Concentrations were generally observed to decrease as the distance

from the Facility and distance from creek increased. PCB concentrations also generally decreased as elevation of the property above the creek water surface increased. In general, the highest results were found upstream, and decreased as the work progressed downstream. A summary of investigative sample results is presented in Tables 3.1.1 through 3.1.22.

Sampling, sample analysis, and data validation were completed in accordance with the U.S. EPA approved Work Plans and QAPP.

Section 4.0 Removal Action Activities

This section presents activities implemented as part of the RA for the Downstream Parcels.

4.1 Site Preparation

Field activities were initiated following receipt of the necessary property access agreements, and review and approval of the Work Plan by U.S. EPA. In addition to general Site preparation activities (HASP development, assembly of construction support facilities), Site preparation activities specific to the work areas were completed prior to initiating intrusive work. These activities are discussed in detail in Section 3.0 of the approved Work Plan and are summarized below. Some of these provisions were completed for prior work (e.g., Upstream Parcels RA, or RCRA CA) and included:

- Performed surveys of private and public utilities
- Mobilized material, equipment, and personnel necessary to perform the work
- Established site security
- Assembled decontamination facilities for personnel and equipment
- Cleared and disposed vegetation within work limits
- Constructed Site access roads
- Implemented environmental controls, including establishment of air quality and emissions monitoring stations, erosion controls, and containment of stormwater and diversion of the surface water

4.2 Environmental Controls

Environmental controls were put in place prior to intrusive activities to control the migration of potentially impacted dust, sediment, remediation water or stormwater from leaving the work areas. These controls are described in the following subsections.

4.2.1 Fugitive Dust Control

For the duration of the Downstream Parcels RA, the contractor was responsible for the control of fugitive particulates generated by excavation, transportation, and backfilling of soil. These control measures included the following:

- Maintaining fugitive air emissions control measures such as a water misting system to prevent the generation of fugitive air emissions
- Covering work areas with clean soil or interim plastic sheeting
- Maintaining covers over material stockpiles
- Inspecting vehicles leaving work areas, and decontaminating as necessary
- Cleaning paved portions of transportation routes
- Using appropriate covers on trucks hauling material

Air quality at the work zone perimeter was monitoring for TSPs and PCBs. Based on results, adjustments to the work practices were made, as deemed necessary, and in accordance with the AAQMP and corresponding modifications. A summary of the air monitoring results is presented in Section 4.6 of this Report.

4.2.2 Erosion Control

A Rule 5 Sediment and Erosion Control Permit was obtained and the contractor utilized construction methods that minimized the amount of exposed soil within the excavation area, to the extent practical. In areas where slopes exceeded 5-percent grade, the contractor employed silt fences, straw bales, riprap, and/or soil berms to prevent erosion and migration of silt, mud, sediment, and other debris from the work areas.

Silt fences and/or straw bales were placed in ditches and along perimeter areas (including those adjacent to Bailey's Branch Creek) to prevent sediment from migrating off-Site. Termination of the Rule 5 Sediment and Erosion Control Permit is provided in Appendix C.

4.2.3 Surface water/Stormwater Control

Surface water and stormwater controls, including check dams, diversion channels, diversion pumping and piping, and drainage swales, were constructed prior to initiating significant excavation, and were modified or relocated, as appropriate, during the work. Excavation areas were limited in order to maintain controls in unremediated work areas, to keep the amount of exposed soil to a minimum.

Construction of these surface water and stormwater controls was completed prior to initiating excavation to control the potential for off-Site releases and minimized the amount of stormwater contacting potentially contaminated material.

Stormwater and creek water flowing toward the work zones was redirected around the Site perimeter, to the extent practical, through the use of dikes, swales, and dams to minimize the potential for stormwater to contact potentially contaminated soils. Stormwater that came in contact with potentially contaminated material was considered contaminated water, and as such, was collected for treatment prior to discharge. In the event that potentially impacted water came in contact with previously remediated areas, the areas were re-sampled using verification sampling procedures and compared against the applicable cleanup criteria. Appropriate action was then implemented, as necessary, to ensure these affected areas continued to meet cleanup criteria.

4.3 Soil Excavation, Verification Sampling, and Backfilling/Final Grading

4.3.1 Proposed Excavation Limits

The layout of the initial excavation limits were established prior to initiation of removal activities, based on CA investigative samples (see Section 3.0). The preliminary limits were surveyed on the parcels using markers (e.g., stakes, survey paint, and survey flags) prior to excavation activities.

4.3.2 Soil Excavation

The scheduling of excavation activities was coordinated so that activities were completed following construction of stormwater controls.

The contractor performed excavation activities generally in accordance with the following:

i) Excavation work was conducted along creek in limited segments.

ii) Excavations were performed after surface water had been diverted around work areas.

iii) Tasks were conducted in a safe and orderly manner to minimize the movement and double handling of material.

iv) To the extent possible, excavations and movement of soil were scheduled to remove material with a PCB concentration ≥ 50 mg/kg first.

v) The ≥50 mg/kg PCBs soil and sediment were transported off- Site for disposal.

vi) The <50 mg/kg PCBs soil and sediment were excavated and transported to staging piles for sampling to confirm that the soil and sediment were <50 mg/kg PCBs, before transportation off-Site, prior to the Addendum 1 approval, and transporting to the East Plant Area for use as grading fill thereafter.

vii) Verification samples were collected and analyzed for PCBs. To meet the cleanup criteria in the manner described in the Work Plan, additional soil or sediment was removed as necessary, and additional verification samples were collected and analyzed until the cleanup criteria were met.

viii) Upon removal of soil and sediment to exposed bedrock, the surface was cleaned and inspected for any residual contamination in the surficial cracks. If such material was identified the rock was removed (see Section 4.3.7).

ix) To the extent possible, excavation proceeded from upstream to downstream and, where possible, proceeded from higher to lower elevation, to prevent the movement of stormwater runoff from impacted areas to remediated areas.

x) Measures necessary for dust emission control from excavation, soil handling, and transportation activities were carried out.

xi) In-creek sediment removal was coordinated with soil removal.

The final limits of soil excavation for the Downstream Parcels were established based on the verification of the removal of soil containing PCBs above the cleanup criteria; statistically for the floodplain and individually for the stream channel. Excavated material with PCB concentrations ≥50 mg/kg and <50 mg/kg were segregated, prior to transportation for disposal. The completed excavation topography contours for the Downstream Parcels are presented on Figures 4.1.1 through 4.1.20. The estimated volume of material excavated for the Downstream Parcels is presented in Table 4.1. These volumes were calculated using AutoCAD Civil 3D® by comparing the pre-excavation survey to the post-excavation survey; however, since majority of the pre-excavation survey is based on aerial imagery, the calculated volumes can only represent a best estimate of the actual volume of material removed. Due to varying bulking factors including truckloads of bedrock that were also excavated and hauled off-Site for disposal, the actual tonnage of materials removed from the Site was greater than what was calculated by using AutoCAD Civil 3D®. Quantities of material disposed off-Site and placed in the East Plant Area as measured by weigh scales are presented in Table 4.2.

4.3.3 Discrete Characterization Sampling During Excavation

In addition to the initial delineation sampling, grab characterization sampling was conducted during the soil excavation at discrete locations to provide additional guidance for determining excavation limits and to characterize materials for disposal purposes. Characterization

sampling was conducted as an intermediary supplement to verification and stockpile sampling, but not as a replacement.

The typical procedure for characterization sampling involved the following steps:

1) Visual inspections were conducted of soils present near the extent of the excavated area. These soils may have included creek bank soils and residual soils remaining along areas of exposed bedrock, or soils within bedrock fractures not addressed by the verification sampling program. Where necessary, additional characterization samples were collected in areas where the potential for additional PCB contamination was suggested by visual evidence. Samples collected were grab samples.
2) If the area had been excavated to bedrock, the bedrock surface was cleaned with a power-washer to remove residual soil or sediments from the rock surfaces. The water was contained, collected, and conveyed to a water treatment facility. The bedrock surface was then inspected for cracks containing oily sediments or residue. Where necessary, additional characterization samples of materials in identified fractures were taken to determine if breaking-out the fracture to remove the material was necessary.

The sample analyses were reviewed to determine if criteria for cleanup was met. If the cleanup criteria were not met, then additional excavation of soil was completed and/or the fractures were broken out to remove any contaminated material. Where a characterization sample result was ≥50 mg/kg PCBs the excavated material was stockpiled as ≥50 mg/kg PCBs material.

Characterization sample analysis and data validation was completed in accordance with the approved QAPP.

4.3.4 Verification Sampling

After the proposed initial removal limits were obtained, verification samples were collected along the excavation floor and sidewalls according to the grid and linear distances described in the Work Plan and addenda. PCB analytical results were returned on a rapid turnaround basis. The quick turnaround was necessary to minimize the length of time an excavation exceeding the cleanup objectives remained exposed.

Soil samples collected from the Downstream Parcels outside of the stream channel were analyzed for PCBs to determine if the applicable cleanup criterion for PCBs of 1.8 mg/kg had been achieved on a 95-percent UCL of the mean basis throughout each approximate 1/2-acre verification area. If the results indicated the cleanup criteria were not met, additional excavation and verification sampling were conducted until an acceptable result was attained.

The procedure for verification sampling of floodplain soil within the Downstream Parcels involved the following steps:

i) For a 200-foot section of creek and floodplain, an approximate 1/2-acre area (verification area) was surveyed along the creek centerline. The verification areas were approximately 100 feet wide and 200 feet long oriented lengthwise, centered over and roughly parallel with the creek. In areas where the excavation limits were extended 50 feet beyond the limit of the 1/2-acre through verification sampling, an additional 1/2-acre verification area was included to provide coverage for the additional acreage. Verification areas were then subdivided into eight grid blocks. The approximately 50 by 50 foot blocks were adjusted in size to meet the geometry of the creek or the expected excavation limits.

ii) Within the 1/2-acre verification area, soil was excavated from locations where existing site characterization data identified PCBs at concentrations exceeding 1.8 mg/kg. Excavation was conducted to the extent appropriate to achieve a 95-percent UCL of 1.8 mg/kg PCBs based on post-excavation samples for the verification area. Post-excavation verification samples consisted of a 5-point composite sample collected from the top 4 inches of the excavated surface at the eight blocks. Blocks excavated entirely to bedrock were considered to have zero residual PCBs in soil for calculating the 95 percent UCL soil PCB concentration.

iii) For areas where the height of the outermost sidewall of the excavation was greater than six inches, soil samples were collected from the sidewalls for every 50 linear foot section as a 5-point composite sample with sample aliquots collected approximately every 10 linear feet of sidewall. For Parcels 15, 20, and 21 (upstream of the Broomsage Road Bridge), sidewall samples were collected every 25 linear foot as a 5-point composite with sample aliquots collected approximately every 5 linear feet of sidewall, consistent with the sidewall sampling for the Upstream Parcels. Within the 1/2-acre verification area, composite sample analyses were reviewed to ensure that results met the cleanup criterion.

iv) If no composite sample exceeded 1.8 mg/kg PCBs, then the 1/2-acre area was determined to have met the cleanup criterion outlined in the CERCLA AOC and Work Plan, and no further excavation was necessary.

v) If one or more verification sample result was between 1.8 and 5 mg/kg PCBs, attainment of the cleanup criterion was evaluated by calculation of the UCL on the mean across the sample grid. If the 95 percent UCL did not exceed the 1.8 mg/kg PCBs, the 1/2-acre area was determined to have met the cleanup criteria outlined in the CERCLA AOC and Work Plan. If the 95 percent UCL did not meet the 1.8 mg/kg PCBs criterion, then additional excavation was completed.

As outlined in the approved Work Plan, the 95 percent UCL was calculated using a nonparametric bootstrap method, since the verification sample concentrations are not necessarily normally or lognormally distributed. Current U.S. EPA guidance recommends the use of nonparametric methods (including nonparametric bootstrap methods) especially for situations where the probability distribution of a data set is not normal or is difficult to identify (U.S. EPA, 2002). The nonparametric methods do not rely on assumptions about the distribution of the data and are reliable for a wide range of distributions including normal and lognormal data. Bootstrap procedures are robust nonparametric methods that can be used to construct approximate confidence limits for the population mean.

Among the different variations of the bootstrap procedures method, the bias-corrected and accelerated (BCa) percentile method is generally considered to be the most robust and reliable for calculating confidence intervals when the underlying distribution of the data is unknown or difficult to verify (Efron and Tibshirani, 1998). For this reason, the BCa method was used in addition to the Percentile Bootstrap method for calculating the 95 percent UCLs for the 1/2-acre verification area.

The verification procedure for sediment and stream bank material was completed as follows:

i) Sediment material was defined as material collected from the base of the channel. Stream bank material was defined in the CERCLA AOC as material located horizontally to a distance 2 feet from the original stream channel and down vertically to the top elevation of the stream bed after sediment removal. Sediment and stream bank samples were required to meet the cleanup objective of 1 mg/kg PCBs or the excavation completed to bedrock.

ii) The stream banks along the channel were removed by more than the minimum 2 feet distances. Therefore, sidewalls of the creek channel excavation beyond 2 feet from the as-found channel were sampled and verified against the 1.8 mg/kg PCBs criterion for floodplain soil.

iii) Where the excavation was completed to bedrock along the length of the channel, no creek centerline samples were required as excavation to bedrock met the criterion for soils removal, although in some instances excavation continued into the rock (see Section 4.3.6 regarding bedrock removal).

Post excavation verification sampling summary results for the Downstream Parcels are presented on Figures 4.2.1 through 4.2.17 (key maps of the verification area grids are presented on Figures 4.2.0.1 through 4.2.0.6). Back-up calculations used to determine the UCLs

are presented in Appendix D. Laboratory analytical reports and chain of custody documents are presented in Appendix E.

4.3.5 Verification Sampling Data Quality Summary

A total of 10,353 samples were collected for verification purposes, which included 1,039 field duplicate sample sets and 12 equipment blanks. The rate of field duplicate collection met the 10 percent minimum requirement outlined in the approved QAPP. Based on data quality assessment and validation there were a few instances that affected data usability as described below and a few minor issues associated with the verification samples presented in the Work Plan. Data quality issues observed included the following:

- The detected concentrations in 57 samples were qualified as estimated (J) values due to an issue with the matrix spike/matrix spike duplicate (MS/MSD) percent recovery. The percent recoveries in these MS/MSDs of either Arcolor 1016 or Arcolor 1260, the spiking compounds, were elevated above the control limit or the relative percent difference observed in the spike duplicates exceeded the control limit likely due to interference with Aroclors present in the sample. Only positive detections were effected and considered estimated (J). One sample resulted in Arcolor 1254 being considered unusable due to extremely low recovery in the associated MS/MSD and was qualified as rejected (R).
- The laboratory control spike/spike duplicates associated with 27 samples were considered outside the laboratory control limits, and resulted in 59 sample results being qualified as estimated (J) due to recoveries of the spiking compounds elevated above the control limit for Arcolor 1248, Arcolor 1242, and Arcolor 1260.
- The detected concentration of Aroclors in 66 samples and one equipment blank were qualified as estimated (J) value due to surrogate percent recovery outside the laboratory established control limits indicating likely matrix interferences were present in the samples.
- Of 1039 duplicate sample sets collected, 83 sample sets did not meet the field duplicate precision requirements and was qualified as estimated (J) values for at least one Aroclor. One sample reported Arcolor 1260 as non-detect with the associated field duplicate reporting a positive detection. Both results for Arcolor 1260 in this field duplicate set were considered estimated concentrations and qualified (J/UJ).
- Analytical results for Aroclors in 34 samples were considered estimated (J/UJ) due to variance of the continuing calibration standards within the linear range outside the acceptance criteria. Aroclors associated with these non-compliant standards were considered estimated (J/UJ).
- The five point calibration curve for two Aroclors (A-1221 and A-1254) did not meet the minimum linearity requirements in two analytical sequences. A total of 46 samples were

affected by non-compliance of the instrument's initial calibration for Aroclors 1221 and 1254 with associated results qualified as estimated (J/UJ).

- The laboratory method blank prepared with analytical batch met the minimum frequency and were not a factor for 10,353 samples. A total of four samples were associated with laboratory method blanks which showed a positive detection of Arcolor 1248 within five times that in the laboratory blanks. The samples were qualified as non-detect (UJ) in these instances.

The data quality objectives (DQO) in terms of precision, accuracy, representativeness, completeness, and comparability (PARCC) were met during the verification sampling event. There was only one instance of a more significant data quality issue encountered (one unusable result from a total of 86,369 reported results) for a completeness of 99.99 percent which did not result in an exceedance in the percent completeness objective. The minor issues observed did not impact data quantitative usability. No further analysis or sampling is required. Table 4.3 presents the verification sampling results and data quality outliers.

4.3.6 Prescriptive removal at Former Staging Area G

The Downstream Parcels RA Work Plan: Addendum No. 3 – Revision 1 presented revised procedures for excavating a small area of PCB impacted soil beneath the former Staging Area G footprint. The former Staging Area G refers to the remnant of the engineered staging area used to temporarily consolidate and manage impacted soil from the RA west of the Peerless Road bridge. The last of the contaminated soils within the staging area were removed in 2010. The remnants of the former Staging Area G consisted of a clean clay pad and geotextile overlying impacted native materials

The area under and around the staging area was gridded off (50 ft x 50 ft) and a total of 115 borings were advanced. Soil borings were advanced through the clean clay pad, into the native material. Soil samples were collected every 0.5 feet within the native material to a total depth of 4.5 feet. Samples were analyzed with increasing depth until a result was obtained that was ≤1.8 mg/kg. The excavation depth of the grid was determined based on the upper depth of a sample collected within the grid that was ≤1.8 mg/kg PCBs.

Prior to excavation of the impacted soil, the clean clay pad was removed for soil reuse. For grids requiring excavation, 0.5 foot of clean clay was left as a buffer and was excavated and disposed with the impacted native material. Impacted soils ≥50 mg/kg were detected at two locations. This material was excavated, direct loaded into trucks, manifested, and transported to Heritage Industrial Services in Roachdale, Indiana. Impacted soils with <50 mg/kg were excavated, loaded into trucks, and transported to the East Plant Area for use as grading fill.

A summary of the completed excavation grids (limits) and depths is presented on Figure 4.3 and the delineation sample results used to verify the excavation depths and limits were achieved are presented in Table 4.4. The letter of completion documenting the work for RACER is provided in Appendix F.

4.3.7 Bedrock removal

In areas where soil removal was completed to the underlying bedrock, the bedrock was cleaned with a high-pressure power-washer to remove additional sediments and oily residues not accessible with a hydraulic excavator. Wash water was contained and treated prior to discharge.

The cleaned bedrock was left exposed for a couple of days to allow the bedrock to dry following washing. The bedrock was inspected for fractures containing sediment and to determine whether oily residues were present. Sediments and residues in fractures were sampled to identify if they had the potential to re-contaminate the creek. Where material exhibited characteristics similar to other sediment samples collected from within cracks in the same area, discrete samples were not always collected prior to sediment removal.

Fractures containing contaminated material were broken out to competent bedrock or to a point where soil samples from within the fracture(s) meet the cleanup objectives. If samples of the sediment within the bedrock fractures were ≥50 parts mg/kg PCBs, the sediment and excavated bedrock were transported for disposal with the ≥50 mg/kg PCBs material. If the sediment within the bedrock fractures were <50 mg/kg PCBs, the sediment and bedrock were stockpiled and sampled in accordance with the stockpile sampling plan.

4.3.8 Broomsage Road Culvert

Excavation and verification sampling on Parcel 22 extended directly to the Broomsage Road culvert abutment. Soil and sediment was removed to bedrock beneath the culvert between Parcel 22 and Parcel 23. Investigative sample collection around the culvert abutment indicated that removal of PCB-impacted soil above the cleanup criteria would necessitate the removal and subsequent replacement of the culvert.

Broomsage Road was closed at the culvert from October 16, 2006 through January 22, 2007 to allow for demolition of the original culvert, removal of impacted soils, sediment and bedrock, verification sample collection, and reconstruction of the new culvert. Verification sampling was conducted consistent with the Work Plan.

Design of the new culvert was completed by CRA for use by Lawrence County. Lawrence County officials and their engineering consultant, R.W. Armstrong, approved the design and oversaw the construction of the new culvert.

4.3.9 Peerless Road Bridge

Truck traffic related to the creek cleanup was to be directed south on Peerless Road across the Peerless Road Bridge near the corner of Peerless Road and Bud Ikerd Road. When loaded, trucks utilized for the creek cleanup weighed more than 11 tons, which was the load restriction of the Peerless Road Bridge. PCB cleanup of the soils under the old bridge abutments was not an issue for the bridge replacement.

GM entered into an agreement with the Lawrence County Highway Department to replace the Peerless Road Bridge with a structure that would accommodate project truck traffic. Plans and specifications for the bridge were developed by Steadfast Bridges, Division of Biltolast Products, Inc. Approach plans were developed by WTH Engineering, Inc.

Traffic was re-routed while the Peerless Road was closed between April 6, 2005 and May 23, 2005 to allow for the demolition and reconstruction of the bridge. The new bridge was opened to traffic on May 24, 2005. GM agreed to maintain the condition of the new bridge until completion of the clean-up work at the Site, when the Lawrence County Highway Department would assume responsibility for the bridge and any future maintenance of the bridge.

4.3.10 Backfilling/Final Grading

Following confirmation that the cleanup goals were met for an excavated area, restoration plans were developed to accommodate final excavation limits, property owner expectations, and creek/floodplain enhancement. A mixture of clean fill, rock, and gravel substrate as appropriate, was placed within the creek channel. Clean fill and topsoil was placed in the floodplains. Fill sources were characterized prior to importation to ensure they were acceptable, based on chemical analysis. The estimated volume (tons) of soil backfilled for the Downstream Parcels that are either GM LLC or third-party owned is presented in Table 4.5. These volumes were calculated using AutoCAD Civil 3D®. The as-recorded drawings for the Downstream Parcels are presented on Figures 4.4.1 through 4.4.9.

Details of the restoration activities, including seeding, erosion control and habitat enhancement, are discussed in Section 5.0.

4.4 Stockpile Sampling/Waste Characterization

Materials excavated from those areas previously delineated as ≥50 mg/kg PCBs were loaded and transported for disposal without additional sampling. Soil/sediment and rock generated during the <50 mg/kg PCBs excavation underwent additional PCB testing prior to disposal and was completed under three different programs, presented in the following sections. Table 4.6 presents the stockpile sampling analytical results.

4.4.1 Stockpile Sampling for Off-Site Disposal

Material delineated for <50 mg/kg PCBs was stockpiled for further sampling. The results of this stockpile sampling confirmed the PCB concentrations to ensure appropriate disposal for the contaminated material.

The procedure for characterization of stockpiled soils involved the following steps:

i) Soils generated from the excavation areas were stockpiled in on-Site staging pads. If multiple stockpiles were generated at the staging pad, they would remain segregated to prevent cross contamination of material. No additional soils were added once a stockpile was considered ready for sampling.

ii) To determine the tonnage of soils in a stockpile, the approximate dimensions of each stockpile were measured and the mass of soil in tons was calculated using an average soil density of 1.4 tons per cubic yard.

iii) Stockpiles were divided into grids based on the total tonnage of soil calculated, and sampled at a frequency of one 5-point composite sample for approximately 500 tons of soil material. samples were analyzed for PCBs.

iv) Pre-excavation data from the initial delineation sampling event, post-excavation verification data, and stockpile sample data were analyzed to determine the destination for transport and disposal of stockpiled soils. If any of the samples exhibited concentrations of PCBs ≥50 mg/kg, the stockpiled soils were transported and disposed at the Heritage Environmental Services (Heritage) landfill located in Roachdale, Indiana. If pre-excavation, post-excavation verification, and stockpile data exhibited concentrations of PCBs <50 mg/kg, the stockpiled soils from the Downstream Area were transported and disposed of at the Republic Services Inc. Sycamore Ridge Landfill (SRLF) located in Pimento, Indiana.

4.4.2 Stockpile Sampling Procedures for East Plant Area Grading Placement

Following the U.S. EPA approval for the reuse of creek sourced soil with PCB concentrations <50 mg/kg for grading in the East Plant Area, the procedure for characterization of stockpiled soils was revised and documented as Addendum No. 1 to the Work Plan. Stockpile sampling was modified as follows:

- Composite stockpile samples were collected for approximate 500 tons of material (or to a maximum of 27 off-road truckloads).
- A single aliquot of material was collected from individual truckload as it was added to the stockpile. Aliquots were set aside until the completion of the pile, when the aliquots were composited.
- A stockpile was closed when a maximum of 27 loads were dumped in the stockpile or when no more material was to be staged for the day. The number of composited aliquots in the sample depended on the number of truckloads in the stockpile and delineated concentration range, to a maximum of 9 aliquots per composited sample (resulting in a maximum of 3 composited samples per stockpile).
- Per the approved Addendum No. 1, the following are compositing frequencies for approximate 500 tons of material before it could be moved to the East Plant Area, based on the initial PCB delineation concentration ranges:

PCB Delineation Concentration Range (mg/kg)	***Number of Composite Samples Per Approximately 500 tons of Material***
5 to 10	1
10 to 25	2
25 to 50	3

In cases where the PCB concentration delineation range for <50 mg/kg PCBs soils excavated was not well defined, a conservative three samples were typically composited for the stockpile.

- In circumstances where a stockpile was comprised of materials from more than one concentration range, the number of samples composited was consistent with the requirement for the highest PCB concentration range.
- If characterization analytical results confirmed that the material was <50 mg/kg PCB, that material was transported to the East Plant Area for staging in an approved grading area.
- If any of the stockpile characterization samples indicated a concentration ≥50 mg/kg total PCBs, the stockpile was transported off-Site for disposal.

In practice, three samples were taken from a stockpile to due to variability in the delineation concentration range.

4.4.3 Additional Stockpile Sampling Modifications

A modification to the stockpile sampling program was again proposed based on historical results of the stockpile sampling program outlined in Addendum No. 1, decreasing PCB concentrations in verification samples as work progressed downstream, and no excavations proceeding to bedrock in the downstream reaches (soils containing higher PCB concentrations collected in bedrock fractures). Effective March 5, 2007, modifications were made to the stockpiling methods and handling procedure.

The modified procedure for excavating <50 mg/kg PCBs material in Downstream Parcels was as follows:

i. For the initial excavation (first cut) in the <50 mg/kg PCB areas (as defined by the original pre-excavation delineation sampling) composite samples were collected from stockpiles at the end of the work day (or when a pile reaches approximately 500 tons). The composite samples were collected by visually dividing the pile into three sections. Five discrete aliquots were collected from the three sections and composited into one sample for analysis, thereby forming three composite samples per stockpile.

ii. Upon completion of the initial excavation in < 50 mg/kg PCB areas, verification samples were collected from the floor and sidewalls. If the verification samples showed the cleanup criteria had not been met, additional excavation was conducted and the soil stockpiled. Where the verification sample results associated with the additional excavation were < 25 mg/kg PCB, no additional stockpile sampling was conducted and the soil was transported directly to the East Plant Area. Where the verification sample results associated with the additional excavation were >25 mg/kg PCB, the excavation stockpile sampling continued using the above outlined process.

4.5 Transportation and Disposal of Waste

This section summarizes the transportation and disposal of soils/sediment and rock excavated from the Downstream Parcels as part of the Downstream Parcels RA. Soils with concentrations <50 mg/kg PCBs were stockpiled separately from materials with PCB concentrations ≥50 mg/kg.

4.5.1 Transporters and Disposal Sites

Transporters licensed by U.S. EPA, U.S. Department of Transportation (U.S. DOT), and the State of Indiana were used for the transport of soils with concentrations ≥50 mg/kg PCBs. Transporters operated in compliance with applicable State and Federal hazardous waste transportation requirements (i.e., 40 CFR Part 263). Soils removed from the Downstream Parcels with PCB concentrations ≥50 mg/kg PCBs were transported using U.S. Bulk Transport, Inc., Beelman Truck Co., Autumn Industries, and ONYX Industrial Services, Inc., and disposed at the Heritage landfill located in Roachdale, Indiana.

Prior to the approvals for soil reuse in the East Plant Area, soils removed from the Downstream Parcels with concentrations <50 mg/kg PCBs were transported using transporters licensed for general transportation of sanitary wastes, using Autumn Industries, Inc., Beelman Trucking Company, Hanna Trucking, K&A Trucking, Kentuckiana Trucking, Inc., ONYX Industrial Services, Inc., Triax Trucking, and U.S. Bulk Transport, Inc., and disposed of at the SRLF located in Pimento, Indiana. Following the approval for soil reuse as grading fill in the East Plant Area, soil was transported by Young Trucking and U.S. Bulk Transport, Inc. to the East Plant Area and placed in approved grading areas. Material not suitable for use as grading fill in the East Plant Area (e.g., tree stumps, PPE) was transported by U.S. Bulk Transport, Inc., and disposed of at SRLF located in Pimento, Indiana.

4.5.2 Preparation of Off-Site Transport Vehicles

On-road haul trucks transporting material on public roads remained on the access roads and staging area within the support zone, separate from those used by equipment transporting impacted materials from the creek to the staging area. Off-road trucks, which stayed within the exclusion zone, transported contaminated soil from the excavations to the stockpile area. On-road trucks leaving the staging areas were decontaminated (loose soil brushed from sides, tires washed to prevent tracking onto road), and then inspected for exterior cleanliness, secured tarps, proper placarding, manifest/documentation for off-Site disposal or East Plant Area, and to ensure there were no signs of material spillage from the vehicle and/or trailer.

For hauling activities over public roads, transportation was conducted in compliance with Federal, State, and local regulations concerning shipping materials, including the following:

- The number for the transport vehicle/container was displayed visibly
- The box of the transport vehicle/container was cleaned of loose debris or foreign material prior to loading

- The box or container for trucks transporting materials for off-Site disposal (Heritage or SRLF) was lined with a minimum of one layer of 6-one-thousandths of an inch (6-mil) polyethylene sheeting continuous along the bottom and sides. The liner was placed on the floor, extending up the sides, and draped over the sideboards. The liner was pushed into the corners to prevent tearing during loading and transport
- The box or container for trucks transporting low-level PCB materials to the East Plant Area were lined as described for off-Site disposal trucks until March 23, 2006, when approval was given by U.S. EPA to eliminate liners in trucks transporting low-level PCB materials to the East Plant Area
- The materials were loaded in a manner which did not damage the polyethylene liner
- Following loading, the liner was folded over the loaded materials prior to securing the load with an approved tarpaulin in a manner to prevent loss of materials or fugitive dust emissions

CRA completed a Truck Inspection Report for loaded vehicles leaving the Site. The Truck Inspection Report recorded information such as truck number, manifest number, type and origin of waste soils, vehicle condition, and other pertinent information. Truck Inspection Reports were maintained in the CRA field trailer on-Site for a period of six months, and once the Truck Inspection Reports were older than six months, they were sent to CRA's Waterloo, Ontario office for long-term filing.

4.5.3 Manifesting, Labeling, and Documentation

Waste material with ≥50 mg/kg PCBs designated for off-Site disposal was manifested prior to leaving the Site. The manifest forms were consistent with 40 CFR Part 262 "Environmental Protection Agency (EPA) Hazardous Waste Generator Standards", 40 CFR Part 263 "EPA Hazardous Waste Transporter Standards", 40 CFR Part 268, "Land Disposal Restriction Standards", 40 CFR Part 761, "EPA Polychlorinated Biphenyls Rules", and the State of Indiana regulations.

GM retained the Generator manifest copy, the Generator Bill of Lading (BOL) copy, the scale ticket copies, and the Truck Inspection Report. Upon disposal at the Heritage Landfill, the Return to Generator copies of the manifest and BOL, as well as the Certificate of Disposal, were sent to CRA for cross check (to ensure the materials reached their destination) and filing. Note that the BOL was eliminated effective September 5, 2006 when U.S.EPA required generators to use the new Universal Hazardous Waste Manifest form.

Waste material containing <50 mg/kg PCBs designated for off-Site disposal was manifested prior to leaving the Site using a non-hazardous waste manifest specific to the SRLF. GM

retained the Generator manifest copy and the Truck Inspection Report. Upon disposal at SRLF, the Return to Generator manifest copy and the Certificate of Disposal were sent to GM for cross check and filing.

A customized version of CRA's Waste Manager software database program was used to track individual waste containers from generation through disposal. Specifically, the program tracks container start dates, container locations, container contents, regulatory storage/disposal timeframes, container labeling requirements, approved disposal locations, approved waste stream profiles, and shipping documentation, including generating manifests and tracking receipt of returned manifests.

CRA also maintained two daily logs; a log book and a daily spreadsheet, summarizing materials transported from the Downstream Parcels to Heritage, SRLF, and the East Plant Area. These logs recorded information such as total volume/weight of material transported, waste source, description, profile number, transporter, disposal facility, date shipped, start accumulation date, manifest and load number, and manifest/Certificate of Disposal return date. These logs were stored in the on-Site trailer, and have since been transferred to CRA's Waterloo, Ontario office for long-term storage.

The quantities and types of materials (≥50 mg/kg PCBs and <50 mg/kg PCBs) removed off-Site for disposal (as determined by landfill weigh scales) are presented in Table 4.2. sample manifests for Heritage and SLRF, and the truck inspection logs are included in Appendix G.

4.6 Air Quality Monitoring

4.6.1 Air Monitoring Background

CRA conducted a perimeter air monitoring program to evaluate potential exposure to fugitive air emissions resulting from excavation activities within the Downstream Parcels. In order to verify that no unacceptable emissions occurred, air monitoring for the emission of PCBs and TSPs was conducted daily around the Site perimeter during excavation activities at locations between excavation areas and the closest potential receptors. The perimeter air monitoring program was in addition to air monitoring for contractor health and safety, including personnel air monitoring conducted by the contractor as described in the Downstream Parcel Removal Action Work Plan (CRA, May 25, 2004).

In accordance with the AAQMP (CRA, 2003), as modified (CRA, 2004; CRA, 2006) and corresponding modifications, PCB and TSP monitoring was performed around the active work areas, until the AAQMP was terminated in October 2008.

The initial air monitoring program required PCB and TSP monitoring around the active work area on a 24-hour basis. The air-monitoring program yielded average concentrations in the ambient air for the selected compounds over a 24-hour period. Concentrations of PCBs and TSPs were determined by measuring the volume of air and amount of contaminant collected onto absorbent media, or filters, over a 24-hour period. Meteorological readings (i.e., temperature, humidity, and barometric pressure) were recorded daily from nearby weather stations to correct and reduce (for reporting) the measured data to ambient conditions. PCB sampling was completed utilizing U.S. EPA Method TO-4A [Compendium Method TO-4A Determination of Pesticides and Polychlorinated Biphenyls in Ambient Air Using High-Volume Polyurethane Foam (PUF) Sampling Followed by Gas Chromatographic/ Multi-Detector Detection (GC/MD), January 1999]. TSP sampling was completed using U.S. EPA's Reference Method for Determination of Suspended Particulate Matter in the Atmosphere (High-Volume Method) (40 CFR Part 50 Appendix B).

Three modifications were made to the PCB air monitoring program during the excavation/cleanup activities being conducted as part of the Work Plan. The first modification was in accordance with a letter to U.S. EPA dated November 23, 2004, which resulted in the reduction in the frequency of PCB air monitoring from daily to weekly except at the soil staging areas and where excavation activities were initiated within 750 feet of an occupied residence or within 500 feet of an active road crossing. Due to reduction of PCB sample result concentrations of sampling in the floodplain, decrease in the handling of ≥50 mg/kg PCBs soil as work progressed downstream and historical PCB air monitoring results, a second modification was completed in accordance with a letter to U.S. EPA dated March 9, 2006. PCB air monitoring was reduced to include only the East Plant Area, Soil Staging Area F, and Soil Staging Area G. Frequency of PCB air monitoring remained at one day per week. High volume TSP sampling was replaced with real-time monitoring for TSP at the perimeter of the excavation and staging areas. The third modification, which included termination of the remaining high-volume 24-hour PCB and TSP air monitoring and continuation of real-team monitoring (by contractors) of TSPs in active work areas, was initiated on October 6, 2008 following U.S. EPA approval, and in accordance with a letter to U.S. EPA dated October 29, 2008.

PCB and TSP samples were obtained from air monitoring stations located within thirteen sampling groups positioned around the active work areas, as well as one real-real time monitoring station (named Station 32B) location outside the boundary of any of the air monitoring groups. The locations of the air monitoring stations and groups used during the excavation and cleanup activities are presented on Figure 4.5.

4.6.2 Air Monitoring Results

4.6.2.1 TSP

TSP results for air monitoring Groups 4, 4A, 5, 5A, 6, 6A, 8, 8A, 10, 10A, 10B, 12, and 13, as well as Real-time Stations 25B, 25C, 28A, and 32B are presented in Tables H.1 to H.17 in Appendix H. TSP results were evaluated against the upwind concentration of the air-monitoring group. The Action Level for TSP is 100 percent Allowable, which is defined as 67 percent in excess of the upwind ambient air concentration.

As presented in the TSP result tables in Appendix H, TSP exceedances were observed in air monitoring groups on various dates. It should be noted that dust was also generated by activities other than the excavation, as well as activities from other sources than the GM remediation (i.e., transportation activities throughout the Site). The majority of exceedances occurred at Group 6 air monitoring stations. Air monitoring Station 17, of Group 6, was located just north of Broomsage Road and east of Bailey's Branch. TSP exceedances at this location were correlated to the construction of a clay berm in the vicinity of Station 17, project truck traffic, and other traffic along Broomsage Road.

To minimize the amount of dust generated, the Site contractor employed various dust suppression techniques. These were actions taken in response to observations and TSP monitoring data. Dust suppression techniques utilized include:

- Monitoring weather conditions and forecasts and scheduling work activities in consideration of weather conditions
- Installing a tire wash station for haul trucks leaving the staging pad area
- Replacing gravel entrances to work areas to control track-out of fine particles
- Wetting on-Site and public haul roads
- Adjusting construction techniques
- Restricting vehicle and truck speed
- Increasing street sweeping and washing activities.

4.6.2.2 PCBs

PCB monitoring was conducted at twenty-five air monitoring stations located within the 13 air monitoring groups. PCB results for the twenty-five air monitoring stations are presented in Appendix H.18 through H.42. PCB results for air-monitoring stations used for monitoring PCBs

during the Downstream Parcels RA were consistently below the Stop Work Action Level (1 µg/m^3 PCBs).

4.7 Removal Action Summary

As described above, RA activities included Site preparation; environmental controls including fugitive dust, erosion, and stormwater; soil excavation, verification sampling, and backfilling/final grading; stockpile sampling/waste characterization; and transportation and disposal of waste.

The completed excavation topography figures, post excavation sample summary locations and results, and completed backfill topography figures for the Downstream Parcels are presented on Figures 4.1, 4.2, 4.3, and 4.4. Tables 4.1, 4.2, and 4.5 present an estimated volume of soil/sediment excavated, quantities and types of materials removed off-Site for disposal and an estimated volume of soil backfilled for the Downstream Parcels.

Based on the soil excavation conducted and the verification sampling results, the sediment and soil removal objectives for the downstream parcels have been achieved. Furthermore, based on the verification sampling and stockpile sample results, the excavated material was disposed of at an appropriate U.S. EPA approved facility.

Section 5.0 Restoration Activities

The objectives of the restoration activities were as follows:

- Restore disturbed areas generally similar to preexisting conditions.
- Comply with Access Agreement requirements or property owner's requests for non-GM LLC owned Parcels.
- Re-vegetate areas with native plant species, after review with the Parcel owner (private or owned by General Motors Corporation).
- Construct habitat features consistent with the stream type and size.

Restoration of privately owned Parcels was based on Access Agreements acceptable to both the individual Parcel owners and GM, as well as stream design plans reviewed by U.S. EPA and the State. Where the Parcel had new ownership prior to restoration, discussion with the new owners on any modification of the restoration plan was conducted prior to implementation (i.e. Parcel 36). Although the Access Agreements contain similar elements, some privately owned Parcel owners requested restoration requirements unique to their property. These restoration

elements are further described in the following sections. Restoration as-built features are presented on Figures 5.1.1 through 5.1.9.

Restoration consisted of four basic components: grading and soil, seeding and stabilization, trees and shrubs, and habitat enhancements.

5.1 Basic Creek, and Bank, and Floodplain Restoration

The creek channel, bank, and floodplain were restored using materials similar to those present in the creek prior to the RA. Backfill materials were screened for desired chemical and geotechnical properties prior to being brought on-site for use in the restoration activities. Soil, gravel and rock for the restoration were provided by Ben's (previously Ingram's) Quarry, located in Springville, Indiana.

Clean fill, mixed with rock/gravel substrate, as appropriate, was placed in the creek channel where soil was removed, upstream of the Peerless Road Bridge. Restoration of the creek channel downstream of the Peerless Road Bridge (Parcel 40) was brought back to similar pre-construction elevations using a combination of gravel, riprap, and soil.

The floodplain adjacent to the creek was restored to generally similar pre-construction elevations using imported common fill, overlain by a minimum 6 inches of topsoil. The floodplain was graded to drain to the creek system.

A series of cascading ponds were constructed to take advantage of the deep excavations on Parcels 24 and 25. Habitat enhancement features were installed in the ponds as well as in the creek channel to attract and provide habitat for a variety of wildlife species. Habitat features include vortex weirs, vernal ponds, root wads, snags, and perches. Wetlands as well as ponds were established in these areas.

To prevent excessive erosion and to allow the creek banks to reach a naturally stable condition, planting was completed following backfill and grading operations. The surface of the creek banks were overlain with a biodegradable erosion control protection, where required by the design, after planting to provide initial erosion protection.

The creek banks were sloped to provide stability during large flow events. In areas where the creek banks were originally unstable and showing visible signs of erosion, the creek banks were protected by grading back the banks to a slope no greater than 1V:2H. In addition to the sloped banks, log vortex weirs, log deflectors, and bank armoring features were constructed to protect the banks during the larger flow events. These features also provide instream habitat for aquatic biota.

5.2 Basic Creek, and Bank, and Floodplain Re-Vegetation

A variety of seed mixes were used to stabilize and provide ground cover for the restored areas. The specific mix used was dependent on the hydrologic regime, future use of the area, the slope of the restored area, and specific requests made by the property owners. A few property owners requested a variety of seed mixes including a pasture seed mix, a turkey/deer seed mix, and a soybean/wheat mix. Further, some property owners also requested that trees not be planted on their properties. The remaining seed mixes were designed to provide natural ground cover for a variety of different habitats (i.e., riparian forest, sloped forest, and emergent wetlands).

On privately owned properties with Access Agreements, shrubs, seedlings (0.75-1.0 inch diameter – "1-gallon pails"), and tree whips were planted. Species, planting densities, and tree diameter were specified in the restoration plans developed for individual Parcels and in accordance with the Parcel-specific Access Agreements.

For Parcels, owned at the time of restoration by General Motors Corporation, the selection of tree species generally followed the guidelines for restoration of riparian habitats developed by the Indiana Department of Natural Resources (IDNR).

Re-vegetation features (trees and shrubs) are documented on Figures 5.1.1 through 5.1.9.

5.3 Concrete Sealing of Bailey's Branch Creek and Tributary 3

Conventional restoration on portions of Parcel 15 and 216 along the Bailey's Branch creek was not practical due to the Interim Measure selected to seal this portion of the creek. A portion of the creek was sealed using concrete and geosynthetic clay liner (GCL) to reduce the volume and PCB concentration of water emanating at Spring 018 (Figure 5.1.1). Construction details for this work were previously presented in CRA's report, the "Construction Certification Report – Bailey's Branch Creek and Tributary 3 Concrete Sealing – Spring 018 Interim Measure," dated February 20, 2014 (report attached in Appendix I).

5.4 Restoration Summary

The disturbed and excavated areas of the Downstream RA were restored to generally similar to pre-existing conditions, as modified by property specific requests by landowners.

Section 6.0 Summary

A summary of the RA activities for the Downstream Parcel identifying the total number of delineation and verification samples collected, and the quantity of soil excavated, and quantity of soil backfilled is presented on Table 6.1.

{S-015-101304-CH-6006 0.10}

- SAMPLE ID
- TOTAL PCB CONCENTRATION OF COMPOSITE SAMPLE IN GRID in mg/kg
- DUPLICATE SAMPLE
- SAMPLING ROUND NUMBER

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to < 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results							

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is issued in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

R1 S-015-110904-CH-6268 8.90

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

- SAMPLING ROUND NUMBER

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is issued in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - – if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- – UCL calculations are performed on Aroclors 1242, 1248,1254, and 1260 using half the quantitation limit where ND results are reported.
- – UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results							

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
− if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
− UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
− UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results											

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
− if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
− UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
− UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

POST EXCAVATION VERIFICATION
SAMPLE SUMMARY LOCATIONS AND RESULTS
DOWNSTREAM PARCELS REMOVAL ACTION
GM CET BEDFORD FACILITY
Bedford, Indiana

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results							

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
- If all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.

b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results											

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.

- UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results									

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
− if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

		BCa Bootstrap 95% UCL	1.15 mg/kg		

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results							

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - – if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- – UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- – UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.

b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.

− UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.

− UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
− if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
- if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.

b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
− if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
− UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
− UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
− UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
− UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
- if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.

b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

(8). The verification figure is presented to show progress for this reporting period. Excavation verification may not be complete as statistical analysis or further excavation may be required.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
− if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
− UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
− UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

- a.) Soils to ≤ 1.8 mg/kg.
  - – if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- – UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- – UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

(8). The verification figure is presented to show progress for this reporting period. Excavation verification may not be complete as statistical analysis or further excavation may be required.

UCL Calculations		Not Required Based on Sample Results							

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - − if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- − UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- − UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
− if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
− UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
− UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
− if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
− UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
− UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
− if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
− UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
− UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.
(8). Verification samples collected from creek bank and creek bottom north of Verification Area 415. Sample results < 1.0 mg/kg were scraped and resampled. Delineation indicated soil sample results were less than 1.8 mg/kg.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results			

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results					

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
– if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
– UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
– UCL calculations included both floor and sidewall samples.
(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results							

GENERAL NOTES:

(1). Cleanup Criteria
- a.) Soils to ≤ 1.8 mg/kg.
  - – if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.
- b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- – UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- – UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

GENERAL NOTES:

(1). Cleanup Criteria

a.) Soils to ≤ 1.8 mg/kg.

- if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.

b.) Sediments to ≤ 1 mg/kg.

(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.

(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.

(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.

(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.

- UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.

(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

UCL Calculations		Not Required Based on Sample Results							

GENERAL NOTES:
(1). Cleanup Criteria
a.) Soils to ≤ 1.8 mg/kg.
- if all results are < 5.0 mg/kg, the cleanup objective can be verified in the Verification Area (approximately 100ft x 200ft) by calculating the Upper Confidence Limit (UCL) of the average concentration using statistics, if the UCL is ≤ 1.8 mg/kg the cleanup objective will be met for the given Verification Area. A value of 0 mg/kg is used in the UCL calculation for sample grids excavated to bedrock.

b.) Sediments to ≤ 1 mg/kg.
(2). Composite sidewall samples were collected in the location where the sidewall of the excavation exceeded 6 inches in height.
(3). The surficial confirmation samples (8 composites per Verification Area except where bedrock is encountered) were collected after the soil/sediment removal was performed.
(4). A value of 0 mg/kg is used for ND in the calculation of Total PCBs.
(5). For UCL calculations, Aroclors 1016, 1221, and 1232 have been assigned a ND value of 0 mg/kg based upon their lack of presence in the data.
- UCL calculations are performed on Aroclors 1242, 1248, 1254, and 1260 using half the quantitation limit where ND results are reported.
- UCL calculations included both floor and sidewall samples.

(6). The sampling round (e.g. R1, R2, etc.) correlates to Verification Area grids or sidewalls where additional rounds of excavation were completed due to exceedances of the cleanup criteria.
(7). Property boundary locations approximated from the Lawrence County survey plats. Locations may not accurately represent the true property boundaries.

TABLE 4.1

ESTIMATED VOLUME OF WASTE MATERIAL EXCAVATED
DOWNSTREAM PARCELS REMOVAL ACTION
CONSTRUCTION CERTIFICATION REPORT
GM CET BEDFORD FACILITY
BEDFORD, INDIANA

Parcel	**Excavated Volume** *(cubic yards)*	**Excavated Tonnage** *(tons)*
13	900	1,350
15	6,900	10,350
20	16,200	24,300
21	4,100	6,150
216 (East of Bailey Scales Road)	3,000	4,500
23	8,900	13,350
24	3,300	4,950
76	900	1,350
78	2,000	3,000
25	29,100	43,650
28	72,200	108,300
29	700	1,050
30	53,400	80,100
36	251,000	376,500
72	200	300
37	3,800	5,700
38	3,800	5,700
39[4]	244,000	366,000
40	72,200	108,300
81	6,000	9,000
Total	**782,600**	**1,173,900**

Notes:

1. Volumes were calculated using AutoCAD Civil 3D®.
2. Excavation volumes were completed by comparing the pre-excavation survey to the final excavation survey.
3. Used conversion of 1 cubic yard = 1.5 tons in tonnage conversion tons.
4. Excludes volume removed under Staging Area G from the Addendum No. 3 prescriptive removal.

TABLE 4.2

ESTIMATED TONNAGE OF WASTE MATERIAL
(SOIL AND BEDROCK REMOVED)
DOWNSTREAM PARCELS REMOVAL ACTION CONSTRUCTION CERTIFICATION REPORT
GM CET BEDFORD FACILITY
BEDFORD, INDIANA

	Volume Estimate [1]	*Estimated Tonnage of Soil Removed* [2]		
Parcel	***Cubic Yards***	***< 50 mg/kg***	***> 50 mg/kg***	***Total***
13	900	-	2,486	2,486
15	6,900	11,222	2,300	13,522
20	16,200	26,347	5,400	31,747
21	4,100	6,668	1,367	8,035
216 (East of Bailey Scales Road)	3,000	4,879	1,000	5,879
23	8,900	14,474	2,967	17,441
24	3,300	5,367	1,100	6,467
76	900	1,464	300	1,764
78	2,000	3,253	667	3,919
25	29,100	47,326	9,700	57,026
28	72,200	117,421	24,067	141,488
29	700	1,138	233	1,372
30	53,400	86,846	17,800	104,646
36	251,000	408,210	83,667	491,877
72	200	325	67	392
37	3,800	6,180	1,267	7,447
38	3,800	6,180	1,267	7,447
39[3]	244,000	396,826	81,333	478,159
40	72,200	117,421	24,067	141,488
81	6,000	9,758	2,000	11,758
Total	**782,600**	**1,271,306**	**263,052**	**1,534,358**

Notes:

1. Volume Estimate calculated from final excavation survey data and and pre-excavation survey using AutoCAD Civil 3D®.
2. Estimate based on actual tonnages from disposal log and volume place in East Plant Area. Sources listed in log with combined waste sources (i.e. waste sourced from multiple parcels) were distributed using an average weighted using the estimated volume removed (see Note 1).
3. Exlcudes volume removed under Staging Area G from the Addendum No. 3 prescriptive removal.
